INTRODUCTION

This **TRAFFIC IMPACT STUDY**, prepared at the request of the Town of McCordsville on behalf of Lennar, is for a proposed residential development known as “Summerton” that will be located in the northwest quadrant of CR 900 N & CR 500 W in McCordsville, Indiana.

PURPOSE

The purpose of this analysis is to determine what impact traffic generated by the proposed residential development will have on the existing adjacent roadway system. This analysis will identify any existing roadway deficiencies or ones that may occur in the future.

Conclusions will be reached that will determine if the roadway system can accommodate the anticipated traffic volumes or will determine the modifications that will be required to the system if there are identified deficiencies.

Recommendations will be made that will address the conclusions resulting from this analysis. These recommendations will address feasible roadway system improvements to provide safe ingress and egress, to and from the proposed residential development, with minimal interference to traffic on the public street system.

SCOPE OF WORK

The scope of work for this analysis is as follows:

First, obtain peak hour turning movement traffic volume counts between the hours of 6:30 AM and 8:30 AM and 4:00 PM and 7:00 PM at the following intersections:

- CR 1000 N & CR 600 W
- CR 1000 N & CR 500 W
- CR 900 N & CR 600 W
- CR 900 N & CR 500 W
- CR 500 W & SR 67

Second, adjust existing traffic volumes to account for reduction in traffic volumes caused by COVID-19.

Third, obtain the number of trips that will be generated and assigned at the study intersections by the nearby future development known as Vinter’s Park.

Fourth, estimate year 2025 background traffic volumes by applying a 1% per year growth rate to the adjusted traffic counts.

Fifth, estimate the number of peak hour trips that will be generated by the proposed residential development.

Sixth, assign and distribute the generated peak hour traffic from the proposed residential development to each of the study intersections.

Seventh, prepare a capacity analysis, level of service analysis and turn lane analysis at the study intersections for each of the following scenarios:

Scenario 1: Adjusted Existing Traffic Volumes – Based on adjusted existing traffic volumes.

Scenario 2: Proposed Development Traffic Volumes – Based on the sum of adjustment existing traffic volumes and generated traffic volumes from the proposed development.

Scenario 3: Year 2025 Background Traffic Volumes – Based on applying a 1% per year growth rate to adjusted existing traffic volumes and accounting for traffic generated by the nearby Vinter's Park development.

Scenario 4: Year 2025 Proposed Development Traffic Volumes – Based on the sum of year 2025 background traffic volumes and generated traffic volumes from the proposed development.

Eighth, prepare recommendations for the roadway geometrics that will be needed to accommodate the future traffic volumes.

Finally, prepare a **TRAFFIC IMPACT STUDY** report documenting all data, analyses, conclusions, and recommendations to provide for the safe and efficient movement of traffic through the study area.

DESCRIPTION OF THE PROPOSED DEVELOPMENT

The proposed development will be located in the northwest quadrant of CR 900 N & CR 500 W in McCordsville, Indiana. The proposed residential development will consist of 287 single-family homes. As proposed, the site will be served by two access drives along CR 500 W and one access drive along CR 900 N. **Figure 1** is an area map showing the location and general layout of the proposed site.

FUTURE NEARBY DEVELOPMENT

It is anticipated that the proposed Vinter's Park will be fully constructed and occupied in the near future. Therefore, the traffic impact study for this development was considered in this project to account for traffic generated by Vinter's Park.

FIGURE 1
AREA MAP

TRAFFIC IMPACT STUDY
LENNAR HOMES
McCORDSVILLE, IN

STUDY AREA

The study area for this analysis has been defined to include the following intersections:

- CR 1000 N & CR 600 W
- CR 1000 N & CR 500 W
- CR 900 N & CR 600 W
- CR 900 N & CR 500 W
- CR 500 W & SR 67
- CR 500 W & Proposed North Access Drive
- CR 500 W & Proposed South Access Drive
- CR 900 N & Proposed Access Drive

Figures 2A and **2B** show the existing intersection geometrics at the study intersections.

DESCRIPTION OF ABUTTING STREET SYSTEM

The proposed residential development will be primarily served by the public roadway system that includes SR 67, CR 1000 N, CR 600 W, CR 900 N, and CR 500 W.

TABLE 1 – DESCRIPTION OF THE ABUTTING STREET SYSTEM

STREET NAME	NUMBER OF LANES	SPEED LIMIT (MPH)	FUNCTIONAL CLASSIFICATION
SR 67	2	55	Major Arterial
CR 600 W	2	40	Major Arterial
CR 1000 N	2	45	Minor Arterial
CR 900 N	2	45	Major Collector
CR 500 W	2	50	Minor Collector

EXISTING TRAFFIC VOLUMES & PEAK HOURS

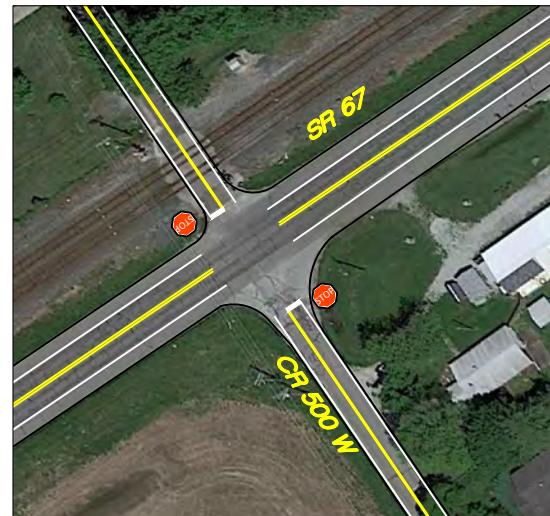

Turning movement traffic volume counts were collected by A&F Engineering at the study intersections between the hours of 6:30 AM to 8:30 AM and 4:00 PM to 7:00 PM during a typical weekday in November 2020 under good weather conditions. According to the turning movement counts, the AM and PM peak hours vary slightly at each study intersection. Hence, the actual peak hours are used at each study intersection to create a “worse-case” scenario. The intersection count output summary sheets and the peak hour volumes are included in the **Appendix**.

ADJUSTED EXISTING TRAFFIC VOLUMES

The existing traffic counts were compared to historic data from a previous study conducted by A&F Engineering to account for the traffic reductions caused by COVID-19. A comparison of the data sets has shown that 2019 traffic volumes are approximately 20% higher than 2020 traffic counts. Therefore, an adjustment factor of 1.20 was applied to the AM and PM peak hour turning movement traffic volumes to calculate the adjusted existing traffic volumes shown in **Figure 3**.

FIGURE 3
ADJUSTED EXISTING TRAFFIC VOLUMES

YEAR 2025 BACKGROUND TRAFFIC VOLUMES

In order to account for annual growth in traffic that would occur due to future development, a 1% annual growth rate was applied to the adjusted existing traffic volumes. Therefore, a growth factor of 1.05 was applied to the adjusted existing volumes to calculate the year 2025 projected traffic volumes. In addition, the generated traffic volumes from the nearby Vinter's Park development were added to the year 2025 projected traffic volumes to yield year 2025 background traffic volumes. **Figure 4** illustrates these traffic volumes.

GENERATED TRIPS FOR PROPOSED DEVELOPMENT

The estimate of newly generated traffic is a function of the development size and of the character of the land use. The ITE *Trip Generation Manual*¹ was used to calculate the number of trips that will be generated by the proposed Summerton development. This report is a compilation of trip data for various land uses as collected by transportation professionals throughout the United States in order to establish the average number of trips generated by those land uses. **Table 1** summarizes the total trips that will be generated by the subject site.

TABLE 2 –GENERATED TRIPS FOR PROPOSED SUMMERTON DEVELOPMENT

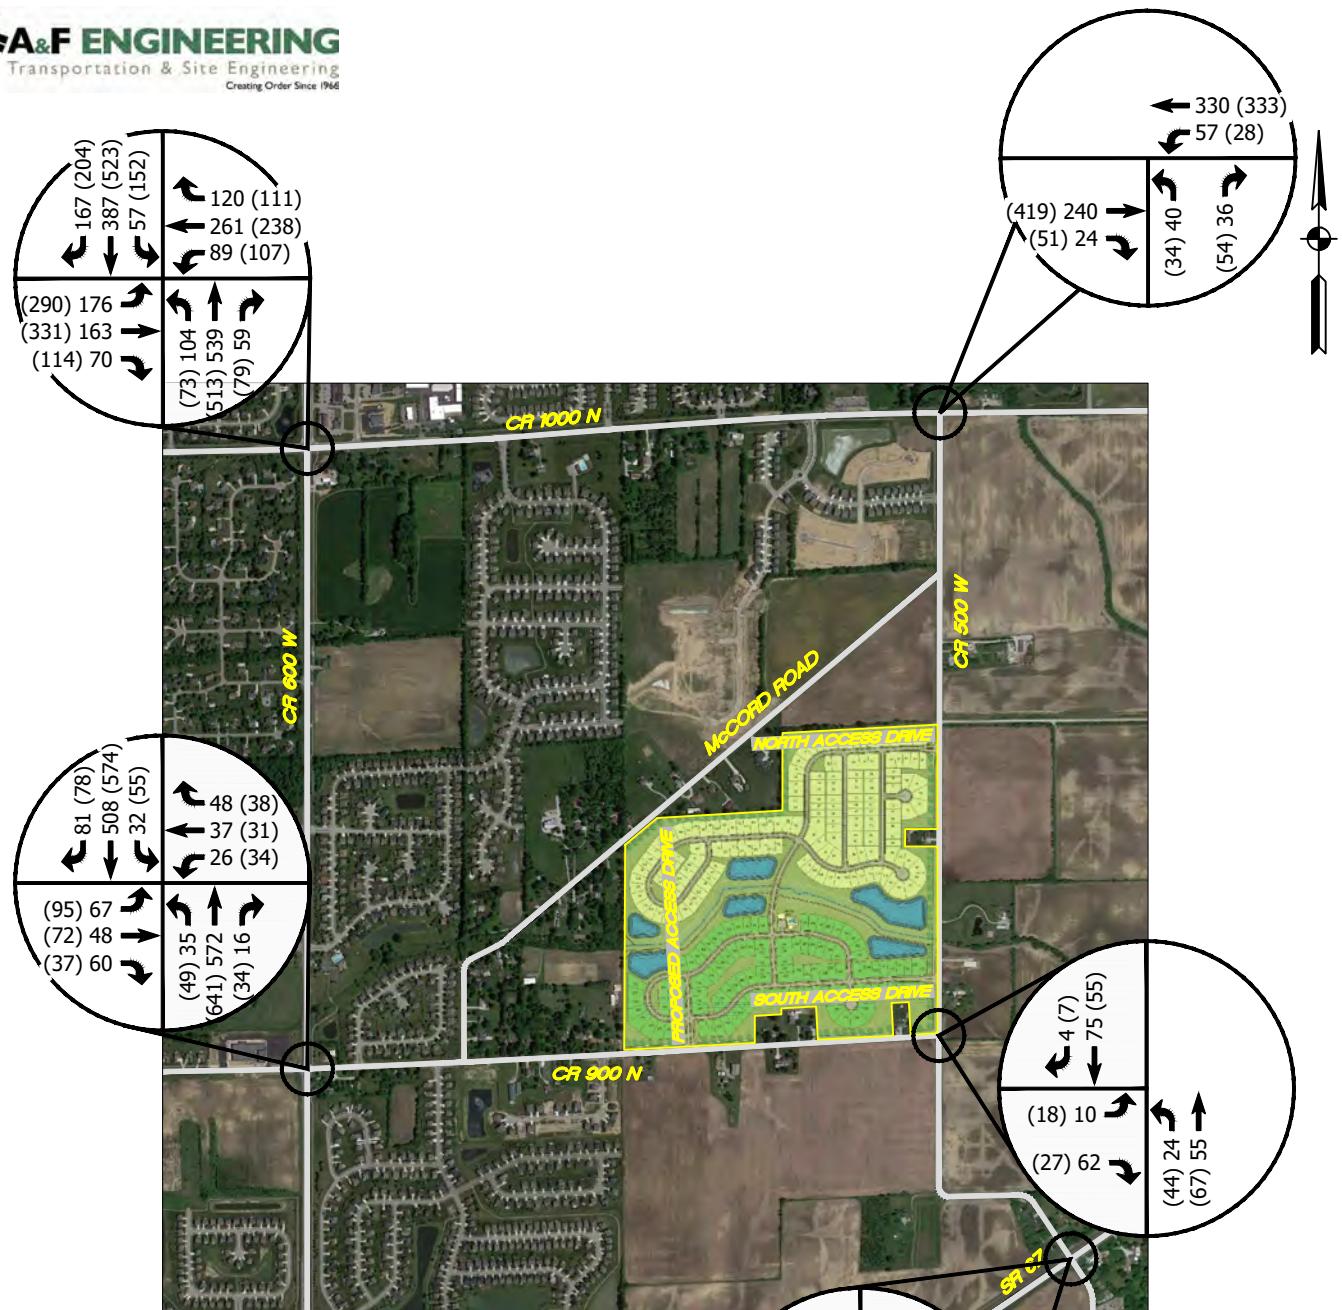

DEVELOPMENT INFORMATION			GENERATED TRIPS			
LAND USE	ITE CODE	SIZE	AM		PM	
			ENTER	EXIT	ENTER	EXIT
Single-Family Housing	210	287 DU	52	157	176	104

PASS-BY & INTERNAL TRIPS

Pass-by trips are trips that are already in the existing traffic stream along the adjacent public roadway system that enter a site, utilize the site, and then return back to the existing traffic stream. Residential developments do not typically attract a significant number of pass-by trips. Therefore, pass-by trip reductions are not included in this study.

An internal trip results when a trip is made between two or more land uses without traversing the external public roadway system. The proposed development is a single land use only. Hence, internal trip reductions are not considered in this study.

**YEAR 2025 BACKGROUND
TRAFFIC VOLUMES**

ASSIGNMENT AND DISTRIBUTION OF GENERATED TRIPS

The study methodology used to determine the traffic volumes from the site that will be added to the street system is defined as follows:

1. The volume of traffic that will enter and exit the proposed development must be assigned to the access points and to the public street system. Using the traffic volume data collected for this analysis, traffic to and from the site development has been assigned to the proposed driveways and to the public street system that will be serving the site.
2. To determine the volumes of traffic that will be added to the public roadway system, the generated traffic must be distributed by direction to the public roadways at their intersection with the driveways. For the proposed development, the trip distribution was based on the location of the development, the existing traffic patterns, and the assignment of generated traffic.

Figure 5 illustrates the assignment and distribution of generated traffic volumes for the proposed Summerton development.

GENERATED TRIPS ADDED TO THE STREET SYSTEM

The total generated traffic volumes that can be expected from the proposed development has been assigned to each of the study intersections. These volumes were determined based on the previously discussed trip generation data, assignment of generated traffic and distribution of generated traffic. The total peak hour generated traffic volumes from the proposed Summerton development are shown in **Figure 6** while the peak hour generated traffic volumes from the nearby Vinter's Park development is shown on a figure in the **Appendix**. In addition, **Figure 7** shows the sum of adjusted existing traffic volumes and generated traffic volumes from the proposed development and **Figure 8** shows the sum of year 2025 background traffic volumes and generated traffic volumes from the proposed development.

TURN LANE WARRANT ANALYSIS

A turn lane analysis was conducted to determine if exclusive turn lanes would be warranted at the proposed access drives along CR 500 W and along CR 900 N at the access drives when the proposed Summerton development is constructed. This analysis was done in accordance with the INDOT *Driveway Permit Manual*². The results are summarized in the following table.

CR 500 W & PROPOSED NORTH ACCESS DRIVE		
SCENARIO	RIGHT-TURN LANE	LEFT-TURN LANE
Adjusted Existing Traffic Volumes + Proposed Development Traffic Volumes	X	X
Year 2025 Traffic Volumes + Proposed Development Traffic Volumes	X	X
CR 500 W & PROPOSED SOUTH ACCESS DRIVE		
SCENARIO	RIGHT-TURN LANE	LEFT-TURN LANE
Adjusted Existing Traffic Volumes + Proposed Development Traffic Volumes	X	X
Year 2025 Traffic Volumes + Proposed Development Traffic Volumes	X	X
CR 900 N & PROPOSED ACCESS DRIVE		
SCENARIO	RIGHT-TURN LANE	LEFT-TURN LANE
Adjusted Existing Traffic Volumes + Proposed Development Traffic Volumes	X	X
Year 2025 Traffic Volumes + Proposed Development Traffic Volumes	X	X

✓ = Turn lane warranted; X = Turn lane not warranted

According to the results, no exclusive turn lanes are warranted along CR 500 W and CR 900 N at the access drives. However, exclusive right-turn lanes should be considered at the proposed access drives to safely service vehicles entering the site. The graphs that show the left-turn lane and right-turn lane warrant criteria for each intersection are shown in the **Appendix**.

² INDOT *Driveway Permit Manual*, Indiana Department of Transportation, 2018

CAPACITY ANALYSIS

The "efficiency" of an intersection is based on its ability to accommodate the traffic volumes that approach the intersection. It is defined by the Level-of-Service (LOS) of the intersection. The LOS is determined by a series of calculations commonly called a "capacity analysis". Input data into a capacity analysis include traffic volumes, intersection geometry, and number and use of lanes. To determine the LOS at each of the study intersections, a capacity analysis has been made using the recognized computer program *Synchro/SimTraffic*³. This program allows intersections to be analyzed and optimized using the capacity calculation methods outlined within the *Highway Capacity Manual (HCM 6th Edition)*⁴. The following list shows the delays related to the levels of service for unsignalized and signalized intersections:

<u>Level of Service</u>	<u>Control Delay (seconds/vehicle)</u>	
	<u>UN SIGNALIZED</u>	<u>SIGNALIZED</u>
A	Less than or equal to 10	Less than or equal to 10
B	Between 10.1 and 15	Between 10.1 and 20
C	Between 15.1 and 25	Between 20.1 and 35
D	Between 25.1 and 35	Between 35.1 and 55
E	Between 35.1 and 50	Between 55.1 and 80
F	greater than 50	greater than 80

CAPACITY ANALYSIS SCENARIOS

To evaluate the proposed development's effect on the public street system, a series of traffic volume scenarios were analyzed to determine the adequacy of the existing roadway network. From this analysis, necessary recommendations can be made to improve the public street system so it will accommodate the future traffic volumes. An analysis has been made for the peak hours at each of the study intersections for the following traffic volume scenarios:

Scenario 1: Adjusted Existing Traffic Volumes – Based on adjusted existing traffic volumes. **Figure 3** is a summary of these traffic volumes.

Scenario 2: Proposed Development Traffic Volumes – Based on the sum of adjustment existing traffic volumes and generated traffic volumes from the proposed development. **Figure 4** is a summary of these traffic volumes.

Scenario 3: Year 2025 Background Traffic Volumes – Based on applying a 1% per year growth rate to adjusted existing traffic volumes and accounting for traffic generated by the nearby Vinter's Park development. **Figure 7** is a summary of these traffic volumes.

Scenario 4: Year 2025 Proposed Development Traffic Volumes – Based on the sum of year 2025 background traffic volumes and generated traffic volumes from the proposed development. **Figure 8** is a summary of these traffic volumes.

³ *Synchro/SimTraffic 11*, Trafficware, 2020.

⁴ *Highway Capacity Manual (HCM), 6th Edition* Transportation Research Board, National Research Council, Washington, DC, 2016.

The following tables summarize the peak hour level of service results at each of the study intersections. The *Synchro (HCM 6th Edition)* intersection reports illustrating the capacity analysis results are included in the **Appendix**.

CONCLUSIONS & RECOMMENDATIONS

The conclusions that follow are based on existing traffic volume data, trip generation, assignment and distribution of generated traffic, capacity analyses/level of service results and a field review conducted at the site. Based on the analysis and the resulting conclusions of this study, recommendations are formulated to ensure that the roadway system will accommodate the increased traffic volumes from the proposed residential development.

CR 1000 N & CR 600 W

Capacity analyses for all traffic volume scenarios have shown that this intersection operates and will continue to operate at acceptable levels of service during the AM and PM peak hours with existing intersection conditions.

CR 1000 N & CR 500 W

Capacity analyses for all traffic volume scenarios have shown that all approaches to this intersection operate and will continue to operate at acceptable levels of service during the AM and PM peak hours with existing intersection conditions.

CR 900 N & CR 600 W

Capacity analyses for all traffic volume scenarios have shown that this intersection operates and will continue to operate at acceptable levels of service during the AM and PM peak hours with existing intersection conditions.

CR 900 N & CR 500 W

Capacity analyses for all traffic volume scenarios have shown that all approaches to this intersection operate and will continue to operate at acceptable levels of service during the AM and PM peak hours with existing intersection conditions.

SR 67 & CR 500 W

Capacity analyses for all traffic volume scenarios have shown that the northbound and southbound approaches to this intersection experience increased delays with existing intersection conditions. Additional, capacity analyses have shown that the addition of an exclusive northbound right-turn lane and an exclusive southbound left-turn lane do not significantly improve the northbound and southbound approach delays. Therefore, it is recommended that this intersection be continuously monitored for the installation of a traffic signal.

CR 500 W & PROPOSED NORTH ACCESS DRIVE

Capacity analyses have shown that all approaches to this intersection will operate at acceptable levels of service during the AM and PM peak hours with the following intersection conditions:

- Construction of the access drive with at least one inbound lane and two outbound lanes.
- Stop controlled intersection with the access drive stopping for CR 500 W.
- An exclusive southbound right-turn lane along CR 500 W should be considered at the proposed access drive to safely service vehicles entering the site.

CR 500 W & PROPOSED SOUTH ACCESS DRIVE

Capacity analyses have shown that all approaches to this intersection will operate at acceptable levels of service during the AM and PM peak hours with the following intersection conditions:

- Construction of the access drive with at least one inbound lane and two outbound lanes.
- Stop controlled intersection with the access drive stopping for CR 500 W.
- An exclusive southbound right-turn lane along CR 500 W should be considered at the proposed access drive to safely service vehicles entering the site.

CR 900 N & PROPOSED ACCESS DRIVE

Capacity analyses have shown that all approaches to this intersection will operate at acceptable levels of service during the AM and PM peak hours with the following intersection conditions:

- Construction of the access drive with at least one inbound lane and two outbound lanes.
- Stop controlled intersection with the access drive stopping for CR 900 N.
- An exclusive westbound right-turn lane along CR 900 N should be considered at the proposed access drive to safely service vehicles entering the site.

NOTE : For highways with a design speed below 80 km/h (50 mph) with a DHV < 300 and where right turns > 40, an adjustment should be used. To read the vertical axis of the chart, subtract 20 from the actual number of right turns.
